

WER-EA full evidence-to-application figure

A

Mechanism map

mechanism-evidence

Demulsification and epoxy curing jointly support the proposed interfacial bonding mechanism.

Evidence: Synthetic FTIR/rheology/SEM anchors for WER-EA curing, demulsification, and emulsion stability.

B

Performance window

property-performance

Bonding performance improves within a bounded WER dosage window.

Evidence: Synthetic pull-off and shear strength rows with curing condition.

C

Evidence heatmap

review-evidence-map

Literature evidence is strongest for bonding and weakest for field durability.

Evidence: Synthetic evidence heatmap graded by characterization, performance, and durability coverage.

D

Literature screening

review-evidence-map

Screening narrows broad WER-EA records to mechanism-performance evidence rows.

Evidence: Synthetic literature screening flow with inclusion and exclusion reasons.
