

Polymer composites partial-to-full evidence package

A

Stress-strain

property-performance

Stress-strain response defines the mechanical baseline.

Evidence: Synthetic stress-strain rows with loading condition.

B

Fiber orientation and interface mechanism

process-structure-property

Fiber orientation and interfacial bonding evidence support the structure-property interpretation.

Evidence: Synthetic orientation and interface evidence rows.

C

Fatigue retention

durability-aging

Fatigue retention bounds cyclic-loading performance.

Evidence: Synthetic fatigue cycle and retention rows.

D

Interlaminar shear and fracture mechanism

mechanism-evidence

Interlaminar shear and fracture mechanism evidence bound the delamination claim.

Evidence: Synthetic ILSS and fractography rows.
