

Thermal insulation partial-to-full evidence package

A

Conductivity-density

property-performance

Thermal conductivity is interpreted together with density.

Evidence: Synthetic conductivity-density rows with dry-state test condition.

B

Pore structure

process-structure-property

Pore structure evidence explains the conductivity-density trend.

Evidence: Synthetic SEM or micro-CT pore structure descriptor.

C

Hygrothermal aging

durability-aging

Hygrothermal aging retention bounds the service claim.

Evidence: Synthetic moisture and aging retention rows.

D

Application window

comparison-window

Application window requires conductivity, density, hygrothermal aging, and fire performance together.

Evidence: Synthetic integrated scoring rows including fire performance.
